

Executive KPI Review and Incident Playbook

Document control	Value
Document type	Executive reporting and incident playbook
Owner	Business Operations and Analytics Leadership
Approved by	BI Governance Council, Marketplace Operations, Data Stewardship
Audience	Executives, business operations, BI analysts, and AI copilot users
Effective date	2026-06-01
Review cadence	Quarterly, or within 10 business days of schema or policy changes
Source basis	Public Olist Brazilian E-Commerce dataset and Marketing Funnel dataset descriptions, plus synthetic governance rules for a BI-agent evaluation corpus.
Confidentiality	Internal use only - sandbox corpus; do not represent as official Olist policy

RAG ingestion note: This document is intentionally authored as selectable text, with stable headings, tables, examples, policy precedence notes, and retrieval keywords. Chunk at section boundaries; preserve tables as Markdown or CSV in the vector index.

Version History

Version	Date	Author / owner	Summary of change
1.0	2026-06-01	AI sandbox generator	Initial two-page demo document.
2.0	2026-06-06	BI Knowledge Management	Expanded into searchable internal-style policy with controls, examples, decision rules, and RAG guidance.

Purpose

This playbook defines how the BI copilot should prepare executive summaries and incident-oriented follow-up analysis. It connects warehouse metrics with business review structure and prevents unsupported root-cause claims.

Monthly Business Review Template

Section	Required content	Reason
Business headline	Top metric movement and period-over-period comparison.	Executives need the most important change first.
Commercial health	Revenue, GMV, order count, AOV, top categories.	Explains scale and product/category concentration.
Customer and delivery health	Customer state or region performance, late delivery rate, average delivery days, review score.	Connects operational health to customer experience.
Seller health	Top seller highlights, seller review list, concentration risk.	Identifies account-management and operational priorities.
Growth funnel	MQLs, conversion rate, time to close, closed deal quality.	Connects acquisition funnel to marketplace supply.
Caveats and next questions	Data limitations, low-confidence metrics, recommended follow-up analysis.	Prevents overconfident decisions.

Executive Summary Rules

- Start with the most important metric movement.
- Include time period and filters.

- Separate facts from interpretation.
- Mention when data is incomplete, ambiguous, or low confidence.
- Avoid root-cause claims unless supported by retrieved policy and database evidence.
- Use no more than five key bullets unless the user asks for a detailed report.

Incident Triggers

Incident type	Trigger conditions	Recommended follow-up analysis
Revenue incident	Revenue decreases by more than 20% period over period; GMV decreases while order count remains stable; top category loses more than 30% revenue.	Product category revenue; seller concentration; customer-state distribution; order count versus AOV; delivered versus canceled/unavailable orders.
Delivery incident	Late delivery rate > 18%; average delivery days > 20; high-volume state or seller moves from Green to Escalation or Critical.	Customer state; seller state; product category; freight ratio; average delivery days; late delivery rate.
Review incident	Average review score < 3.5; low review rate > 15%; review score decreases while delivery delays increase.	Review score by category and seller; late delivery rate by review score; low review rate by month.
Marketing incident	Lead conversion rate < 5%; MQL count increases but closed deals do not; average time to close > 45 days.	Lead origin; landing page; business segment; SDR/SR; time to close; downstream seller revenue after close.

Incident Response Narrative Structure

Step	Content requirement
1. Signal	State metric, period, threshold crossed, and magnitude.
2. Scope	Identify impacted customer states, sellers, categories, or lead origins.
3. Evidence	Tie every numerical claim to SQL result and every threshold to retrieved policy.
4. Caveat	State missing data, low volume, or ambiguity.
5. Next action	Recommend analysis, not operational blame, unless evidence supports it.

Executive Summary Example

Example: “Revenue declined 23% month over month while distinct delivered orders declined 6%, pointing to lower AOV rather than only demand volume. The largest category decline is furniture_decor (-34%). This meets the revenue incident trigger. Recommended follow-up: break down revenue by seller concentration and delivered versus canceled/unavailable orders.”

Copilot Behavior

- Use this playbook to structure summaries and recommend next questions.
- Never fabricate a diagnosis from policy text alone.
- Tie every numerical claim to SQL results.
- Tie every threshold or review structure to retrieved document context.

RAG Retrieval Tests

Test prompt	Expected retrieved sections	Expected answer behavior
What does revenue mean in this BI agent?	Metric definitions; caveats; default filters	Use approved definition, cite default filters, ask clarification if user means GMV or paid amount.
Can a viewer see SQL or row-level seller details?	Access levels; SQL visibility; sensitive data rules	Deny raw detail, provide aggregate summary, explain role limitation.
Which sellers or regions need attention this month?	SLA thresholds; seller performance rules; incident triggers	Compute metrics first, apply thresholds, include volume and caveats.

Document End

For production use, replace sandbox owners and thresholds with approved policy owners, legal review, actual access-control groups, and validated database schema contracts.
